¹ Operative Mortality is defined as patient death occurring in the hospital after isolated CABG surgery, regardless of length of stay, or death occurring anywhere after hospital discharge but within 30 days after the isolated CABG surgery. Provider ratings are risk-adjusted using a statistical technique that allows for fair comparison of provider outcomes even though some providers have sicker patients than average.

[#] The performance rating is based on a comparison of each provider's risk-adjusted mortality rate to the California observed mortality rate. Providers are classified as "Better" if the upper 95% confidence limit of their risk-adjusted mortality rates fall below the California observed mortality rate. Providers are classified as "Worse" if the lower 95% confidence limit of their risk-adjusted mortality rates are higher than the California observed mortality rate. A provider is classified as "Average" if the California mortality rate falls within the confidence interval of the provider's risk-adjusted mortality rate.

† The number of CABG cases by surgeon may not equal the total number of CABG cases reported due to various reasons, including unresolved issues of surgeon case attribution and cases not appearing for surgeons who died.
