	UC San Diego Health La Jolla - Jacobs Medical Center & Sulpizio Cardiovascular Center	191(3)	1.72	Average	60(5)	11.56	Average	344(2)	0.61	Average	311(31)	9.90	Average	183	100.00%

<sup>1</sup> **Isolated CABG Operative Mortality** is defined as patient death occurring in the hospital after isolated CABG surgery, up to 90 days, death occurring anywhere after hospital discharge but within 30 days after the isolated CABG surgery or all deaths after transfer to another acute care center up to 90 days. Hospital ratings are risk-adjusted using a statistical technique that allows for fair comparison of hospital outcomes even though some hospitals have sicker patients than average.

<sup>2</sup> **CABG + Valve Operative Mortality** is defined as patient death occurring in the hospital after CABG with Valve surgery (Aortic Valve Replacement, Mitral Valve Replacement or Repair or a combination of these), up to 90 days, or death occurring anywhere after hospital discharge but within 30 days after the surgery, or all deaths after transfer to another acute care center up to 90 days. Hospital ratings are risk-adjusted using a statistical technique that allows for fair comparison of hospital outcomes even though some hospitals have sicker patients than average.

<sup>3</sup> **Post-Operative Stroke** is defined as a post-operative, central neurologic deficit persisting for more than 24 hours after isolated CABG surgery while in the operating hospital. Hospital ratings are risk-adjusted using a statistical technique that allows for fair comparison of hospital outcomes even though some hospitals have sicker patients than average.

<sup>4</sup> **30-Day Readmission** is defined as an isolated CABG surgery patient with an all cause unplanned readmission to an acute care hospital within 30 days of being discharged to home or a non-acute setting . Study population includes patients discharged alive that could be followed-up via hospital patient discharge data. Hospital ratings are risk-adjusted using a statistical technique that allows for fair comparison of hospital outcomes even though some hospitals have sicker patients than average.

<sup>5</sup> **Internal Mammary Artery (IMA) Usage** in CABG surgery is an evidence-based indicator of surgery quality. Most first-time CABG surgery patients are eligible to receive an IMA bypass. Clinical research shows that IMA grafts used in CABG surgery stay open longer and increase patients' survival. Very low hospital utilization rates may be associated with poorer care.

\* The performance rating is based on a comparison of each hospital's risk-adjusted rate and the California observed rate. This is a test of statistical significance. A hospital is classified as "Better" if the upper 95% confidence limit of its risk-adjusted rate falls below the California observed rate. A hospital is classified as "Worse" if the lower 95% confidence limit of its risk-adjusted rate is higher than the California observed rate. A hospital is classified as "Average" if the California rate falls within the confidence interval of the hospital's risk-adjusted rate.

Not Applicable: Hospital performed no CABG procedures that meet criteria for a specific measure.
